ABSTRACT

Sales forecasting is an important field in supermarkets, and it has recently got immense popularity to boost market operations and productivity due to new technologies. The industry has focused on conventional statistical model but in recent years, Machine learning techniques have received more attention.

The use of traditional statistical method to forecast supermarket sales has left a lot of challenges unaddressed and mostly result in the creation of predictive models that perform poorly.

The era of big data coupled with access to massive compute power has made machine learning a goto for sales forecast.

DanNewton Gatobu Mwenda

The objective of this project is to develop a model for predicting sales in supermarkets keeping

Software Engineer
